1 Special issue on ICML: Lyapunov design for safe reinforcement learning

100%

Theodore J. Perkins, Andrew G. Barto

The Journal of Machine Learning Research March 2003

Volume 3

Lyapunov design methods are used widely in control engineering to design controllers that achieve qualitative objectives, such as stabilizing a system or maintaining a system's state in a desired operating range. We propose a method for constructing safe, reliable reinforcement learning agents based on Lyapunov design principles. In our approach, an agent learns to control a system by switching among a number of given, base-level controllers. These controllers are designed using Lyapunov domain ...

2 Learning methods: Sequential cost-sensitive decision making with reinforcement learning

100%

Edwin Pednault, Naoki Abe, Bianca Zadrozny

Proceedings of the eighth ACM SIGKDD international conference on Knowledge discovery and data mining July 2002

Recently, there has been increasing interest in the issues of cost-sensitive learning and decision making in a variety of applications of data mining. A number of approaches have been developed that are effective at optimizing cost-sensitive decisions when each decision is considered in isolation. However, the issue of sequential decision making, with the goal of maximizing total benefits accrued over a period of time instead of immediate benefits, has rarely been addressed. In the present paper ...

3 Using background knowledge to speed reinforcement learning in physical agents

100%

Daniel Shapiro, Pat Langley, Ross Shachter

Proceedings of the fifth international conference on Autonomous agents May 2001 This paper describes Icarus, an agent architecture that embeds a hierarchical reinforcement learning algorithm within a language for specifying agent behavior. An Icarus program expresses an approximately correct theory about how to behave with options at varying levels of detail, while the Icarus agent determines the best options by learning from experience. We describe Icarus and its learning algorithm, then report on two experiments in a vehicle control domain. The first examines the ben ...

4 R-max - a general polynomial time algorithm for near-optimal reinforcement learning

100%

Ronen I. Brafman, Moshe Tennenholtz

The Journal of Machine Learning Research March 2003

Volume 3

R-MAX is a very simple model-based reinforcement learning algorithm which can attain near-optimal average reward in polynomial time. In R-MAX, the agent always maintains a complete, but possibly inaccurate model of its environment and acts based on the optimal policy derived from this model. The model is initialized in an optimistic fashion: all actions in all states return the maximal possible reward (hence the name). During execution, it is updated based on the agent's observations. R-MAX impr ...

5 & epsilon; -mdps: learning in varying environments

99%

István Szita, Bálint Takács, András Lörincz

The Journal of Machine Learning Research March 2003

Volume 3

In this paper ε-MDP-models are introduced and convergence theorems are proven using the generalized MDP framework of Szepesvari and Littman. Using this model family, we show that Q-learning is capable of finding near-optimal policies in varying environments. The potential of this new family of MDP models is illustrated via a reinforcement learning algorithm called *event-learning* which separates the optimization of decision making from the controller. We show that event-learning au ...

6 Hierarchical multi-agent reinforcement learning

99%

Rajbala Makar, Sridhar Mahadevan, Mohammad Ghavamzadeh

Proceedings of the fifth international conference on Autonomous agents May 2001 In this paper we investigate the use of hierarchical reinforcement learning to speed up the acquisition of cooperative multi-agent tasks. We extend the MAXQ framework to the multi-agent case. Each agent uses the same MAXQ hierarchy to decompose a task into sub-tasks. Learning is decentralized, with each agent learning three interrelated skills: how to perform subtasks, which order to do them in, and how to coordinate with other agents. Coordination skills among agents are learned by using j ...

Nobuo Suematsu, Akira Hayashi

Proceedings of the first international joint conference on Autonomous agents and multiagent systems: part 1 July 2002

Stochastic games provides a theoretical framework to multiagent reinforcement learning. Based on the framework, a multiagent reinforcement learning algorithm for zero-sum

stochastic games was proposed by Littman and it was extended to general-sum games by Hu and Wellman. Given a stochastic game, if all agents learn with their algorithm, we can expect that the policies of the agents converge to a Nash equilibrium. However, agents with their algorithm always try to converge to a Nash equilibrium i ...

Proceedings of the second international joint conference on Autonomous agents and multiagent systems July 2003

Much emphasis in multiagent reinforcement learning (MARL) research is placed on ensuring that MARL algorithms (eventually) converge to desirable equilibria. As in standard reinforcement learning, convergence generally requires sufficient exploration of strategy space. However, exploration often comes at a price in the form of penalties or foregone opportunities. In multiagent settings, the problem is exacerbated by the need for agents to "coordinate" their policies on equilibria. We propose a Ba ...

We show how a standard tool from statistics --- namely confidence bounds --- can be used to elegantly deal with situations which exhibit an exploitation-exploration trade-off. Our technique for designing and analyzing algorithms for such situations is general and can be applied when an algorithm has to make exploitation-versus-exploration decisions based on uncertain information provided by a random process. We apply our technique to two models with such an exploitation-exploration trade-off. Fo ...

There are many interesting topics in artificial intelligence that would be useful to stimulate student interest at various levels of the computer science curriculum. They can also be used to illustrate some basic concepts of computer science, such as arrays. One such topic is reinforcement learning - teaching a computer program how to play a game or traverse an environment using a system of rewards and punishments. There are reinforcement learning projects that can be used at all levels of the c ...

Proceedings of the fifth international conference on Autonomous agents May 2001 This paper proposes a model of selective attention for visual search tasks, based on a framework for sequential decision-making. The model is implemented using a fixed pan-tilt-zoom camera in a visually cluttered lab environment, which samples the environment at discrete time steps. The agent has to decide where to fixate next based purely on visual information, in order to reach the region where a target object is most likely to be found. The model consists of two interacting modules. A ...

We report on our reinforcement learning work on Cobot, a software agent that resides in the well-known online chat community LambdaMOO. Our initial work on Cobot~\cite{cobotaaai} provided him with the ability to collect {\em social statistics\/} and report them to users in a reactive manner. Here we describe our application of reinforcement learning to allow Cobot to proactively take actions in this complex social environment, and adapt his behavior from multiple sources of human reward. The ability to learn is a potentially compelling and important quality for interactive synthetic characters. To that end, we describe a practical approach to real-time learning for synthetic characters. Our implementation is grounded in the techniques of reinforcement learning and informed by insights from animal training. It simplifies the learning task for characters by (a) enabling them to take advantage of predictable regularities in their world, (b) allowing them to make maximal use of any ...

Proceedings of the first international joint conference on Autonomous agents and multiagent systems: part 1 July 2002

In this paper we focus on the problem of designing a collective of autonomous agents that

individually learn sequences of actions such that the resultant sequence of joint actions achieves a predetermined global objective. Directly applying Reinforcement Learning (RL) concepts to multi-agent systems often proves problematic, as agents may work at cross-purposes, or have difficulty in evaluating their contribution to achievement of the global objective, or both. Accordingly, the crucial design st ...

Proceedings of the second international joint conference on Autonomous agents and multiagent systems July 2003

The agent approach, as seen by [9], intends to design "intelligent" behaviors. Yet, Reinforcement Learning (RL) methods often fail when confronted with complex tasks. We are therefore trying to develop a methodology for the automated design of agents (in the framework of Markov Decision Processes) in the case where the global task can be decomposed into simpler -possibly concurrent- sub-tasks. Our main idea is to automatically combine basic behaviors using RL methods. This led us to propose two ...

Proceedings of the first international joint conference on Autonomous agents and multiagent systems: part 3 July 2002

This paper investigates the use of experience generalization on concurrent and on-line policy learning in multi-agent scenarios, using reinforcement learning algorithms. Agents learning concurrently implies in a non-stationary scenario, since the reward received by one agent (for applying an action in a state) depends on the behavior of the other agents. Non-stationary scenarios can be viewed as a two-player game in which an agent and the other *player* (which represents the other agents an ...

Proceedings of the first international joint conference on Autonomous agents and multiagent systems: part 2 July 2002

One general strategy for accelerating the learning of cooperative multiagent problems is to reuse good or optimal solutions to the task when each agent is acting alone. In this paper, we formalize this approach as dynamically merging solutions to multiple Markov decision processes (MDPs), each representing an individual agent's solution when acting alone, to obtain solutions to the overall multiagent MDP when all the agents act together. We present a new learning algorithm called MAPLE (MultiAge ...

We consider a finite-state Markov decision problem and establish the convergence of a special case of optimistic policy iteration that involves Monte Carlo estimation of Q-values, in conjunction with greedy policy selection. We provide convergence results for a number of algorithmic variations, including one that involves temporal difference learning (bootstrapping) instead of Monte Carlo estimation. We also indicate some extensions that either fail or are unlikely to go through.
